

# Speeding up Association rules

---

Dynamic Hashing and Pruning technique

**Borrowed from [software.ssu.ac.kr/AI08\\_page/class8-Association%20Rules.ppt](http://software.ssu.ac.kr/AI08_page/class8-Association%20Rules.ppt)**

## DHP: Reduce the Number of Candidates

---

- A  $k$ -itemset whose corresponding hashing bucket count is below the threshold cannot be frequent
  - Candidates: a, b, c, d, e
  - Hash entries: {ab, ad, ae} {bd, be, de} ...
  - Frequent 1-itemset: a, b, d, e
  - ab is not a candidate 2-itemset if the sum of count of {ab, ad, ae} is below support threshold
- *J. Park, M. Chen, and P. Yu. An effective hash-based algorithm for mining association rules. In SIGMOD'95*

# Still challenging, the niche for DHP

- DHP ( Park '95 ): Dynamic Hashing and Pruning
- Candidate large 2-itemsets are huge.
  - DHP: trim them using hashing
- Transaction database is huge that one scan per iteration is costly
  - DHP: prune both number of transactions and number of items in each transaction after each iteration

# How does it look like?

## Apriori

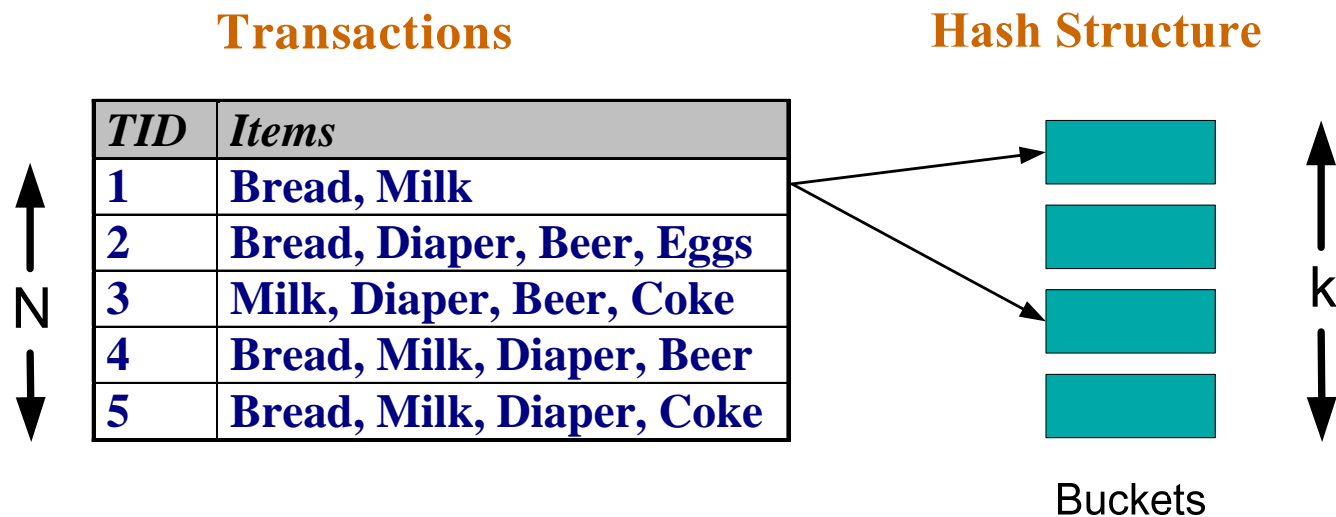

## DHP

# Reducing Number of Comparisons

## Candidate counting:

- Scan the database of transactions to determine the support of each candidate itemset
- To reduce the number of comparisons, store the candidates in a hash structure
  - Instead of matching each transaction against every candidate, match it against candidates contained in the hashed buckets

# Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:

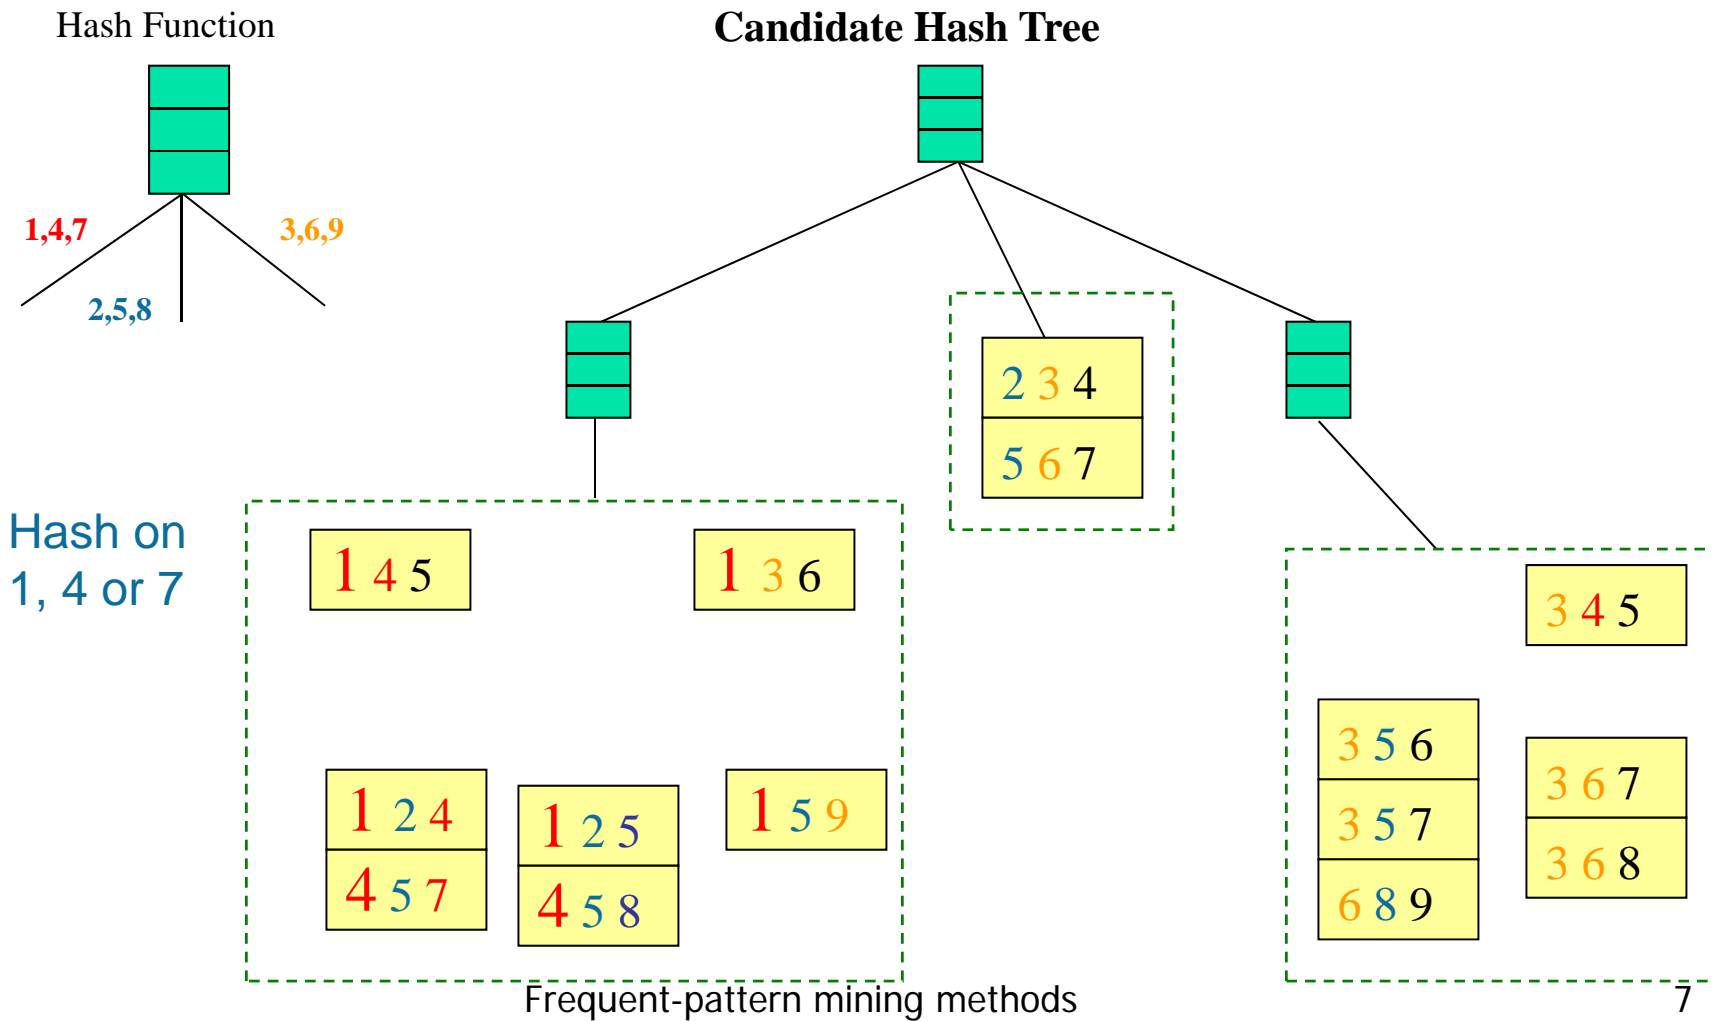

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

You need:

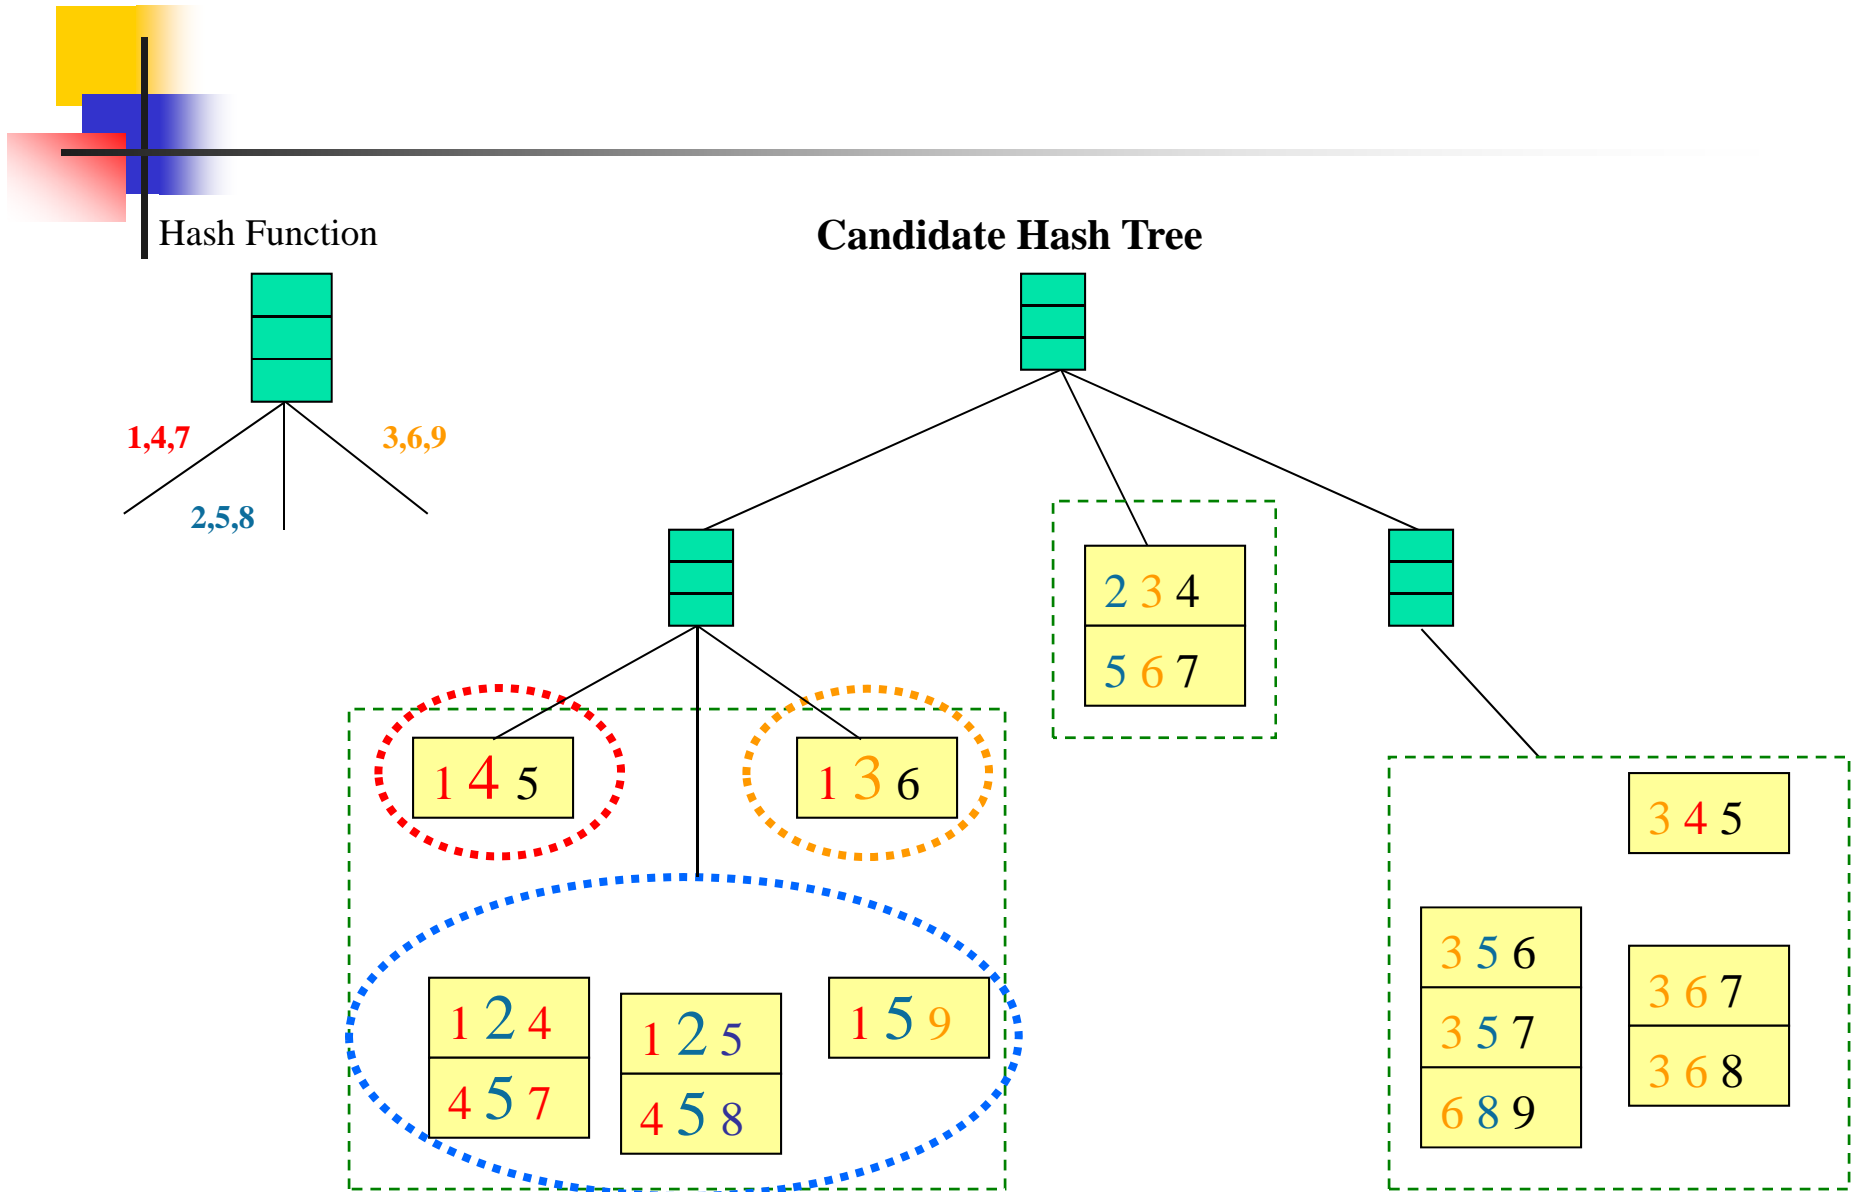

- Hash function
- Max leaf size: max number of itemsets stored in a leaf node (if number of candidate itemsets exceeds max leaf size, split the node)

# Association Rule Discovery: Hash tree

## How to trim candidate itemsets

---

- In  $k$ -iteration, hash all “appearing”  $k+1$  itemsets in a hashtable, count all the occurrences of an itemset in the correspondent bucket.

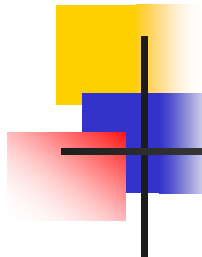

- In  $k+1$  iteration, examine each of the candidate itemset to see if its correspondent bucket value is above the support ( necessary condition )

# Hash Table Construction

---

- Consider two items sets, all items are numbered as  $i_1, i_2, \dots, i_n$ . For any pair  $(x, y)$ , has according to
  - Hash function bucket  $\# =$ 
$$h(\{x, y\}) = ((\text{order of } x) * 10 + (\text{order of } y)) \% 7$$
- Example:
  - Items = A, B, C, D, E,
  - Order = 1, 2, 3, 4, 5,
  - $H(\{C, E\}) = (3 * 10 + 5) \% 7 = 0$
  - Thus,  $\{C, E\}$  belong to bucket 0.

# Example

| TID | Items   |
|-----|---------|
| 100 | A C D   |
| 200 | B C E   |
| 300 | A B C E |
| 400 | B E     |

Figure1. An example transaction database

## Generation of C1 & L1(1st iteration)

| Itemset | Sup |
|---------|-----|
| {A}     | 2   |
| {B}     | 3   |
| {C}     | 3   |
| {D}     | 1   |
| {E}     | 3   |

C1

| Itemset | Sup |
|---------|-----|
| {A}     | 2   |
| {B}     | 3   |
| {C}     | 3   |
| {E}     | 3   |

L1

# Hash Table Construction

- Find all 2-itemset of each transaction

| TID | 2-itemset                           |
|-----|-------------------------------------|
| 100 | {A C} {A D} {C D}                   |
| 200 | {B C} {B E} {C E}                   |
| 300 | {A B} {A C} {A E} {B C} {B E} {C E} |
| 400 | {B E}                               |

## Hash Table Construction (2)

- Hash function

$$h(\{x\ y\}) = ((\text{order of } x) * 10 + (\text{order of } y)) \% 7$$

- Hash table

|       |       |       |  |       |       |       |
|-------|-------|-------|--|-------|-------|-------|
| {C E} | {A E} | {B C} |  | {B E} | {A B} | {A C} |
| {C E} |       | {B C} |  | {B E} |       | {C D} |
| {A D} |       |       |  | {B E} |       | {A C} |

|   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|
| 3 | 1 | 2 | 0 | 3 | 1 | 3 |
|---|---|---|---|---|---|---|

|        |   |   |   |   |   |   |   |
|--------|---|---|---|---|---|---|---|
| bucket | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
|--------|---|---|---|---|---|---|---|

# C2 Generation (2nd iteration)

| L1*L1 | # in the bucket |
|-------|-----------------|
| {A B} | 1               |
| {A C} | 3               |
| {A E} | 1               |
| {B C} | 2               |
| {B E} | 3               |
| {C E} | 3               |

| Resulted C2 |
|-------------|
| {A C}       |
| {B C}       |
| {B E}       |
| {C E}       |

| C2 of Apriori |
|---------------|
| {A B}         |
| {A C}         |
| {A E}         |
| {B C}         |
| {B E}         |
| {C E}         |

# Effective Database Pruning

---

- Apriori

- Don't prune database.
- Prune  $C_k$  by support counting on the original database.

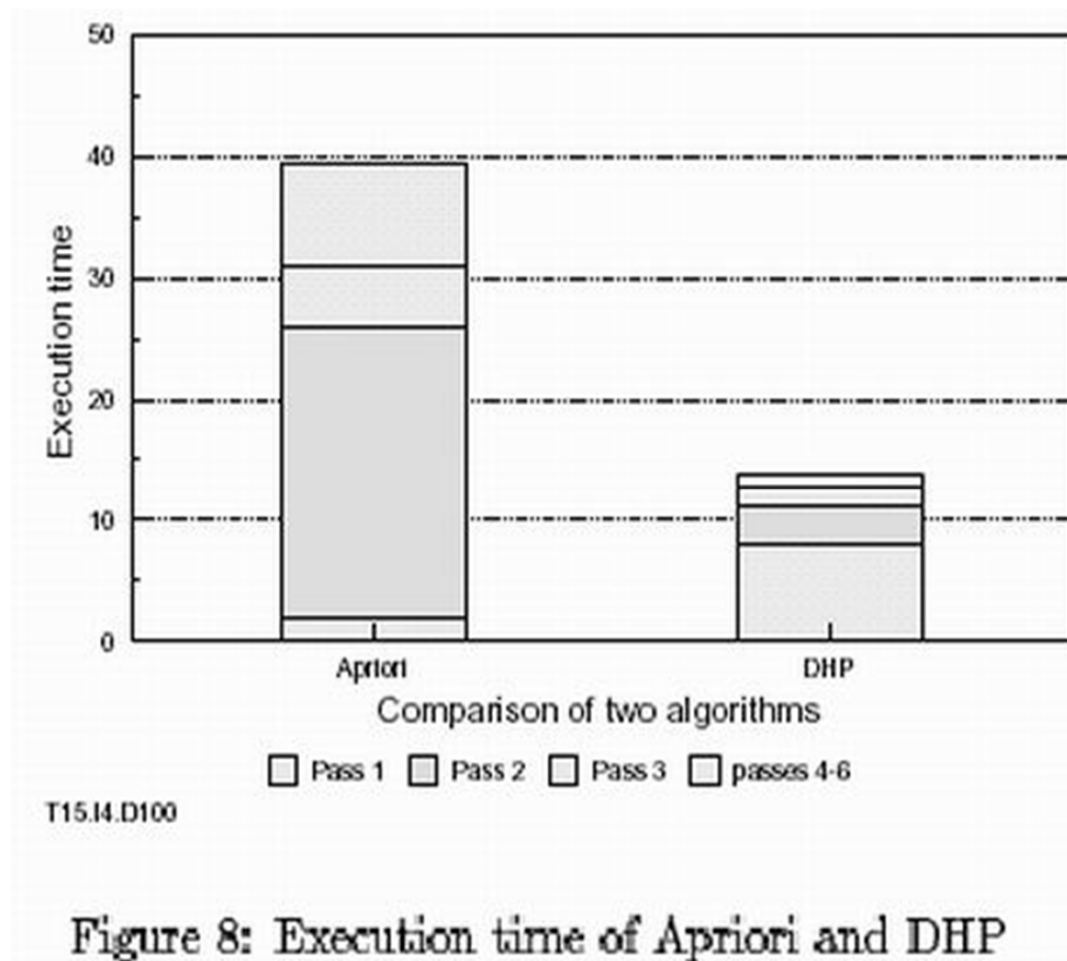

- DHP

- *More efficient support counting can be achieved on pruned database.*

# Performance Comparison

|            | Apriori | DHP    |                  |       |
|------------|---------|--------|------------------|-------|
|            | number  | number | $D_k$            | $D_k$ |
| $L_1$      | 820     | 820    | 6,700KB, 100,000 |       |
| $C_2$      | 335,790 | 338    | 6,700KB, 100,000 |       |
| $L_2$      | 207     | 207    |                  |       |
| $C_3$      | 618     | 618    | 659KB, 20,602    |       |
| $L_3$      | 201     | 201    | 546KB, 17,417    |       |
| $C_4$      | 184     | 184    |                  |       |
| $L_4$      | 98      | 98     | 332KB, 10,149    |       |
| $C_5$      | 30      | 30     |                  |       |
| $L_5$      | 23      | 23     | 24KB, 756        |       |
| $C_6$      | 1       | 1      |                  |       |
| $L_6$      | 1       | 1      |                  |       |
| total time | 39.39   | 13.91  |                  |       |

## Performance Comparison (2)

# Conclusion

---

- Effective hash-based algorithm for the candidate itemset generation
- Two phase transaction database pruning
- Much more efficient ( time & space ) than Apriori algorithm
